

We Now Offer In-House Forklift Battery Maintenance Services

Being proactive is the key to maintaining effective batteries. At JIT, we now handle everything to keep your batteries performing at their best:

- Cleaning and washing
- Watering
- Cell replacement
- Cable repair
- Discharge testing
- Connector and contactor replacement
- And more!

New mobile wash bay

Washing is especially important, because corrosion build up can eventually make contact with the chassis and short out certain components. We'll bring our mobile wash bay to you to clean the battery's casing, cells, and watering system to increase its lifespan.

Before and after going through our mobile wash bay

Meet the Head of Our New Battery Division, Bill Larkin

Call us to maintain, service, and repair your forklift batteries

"I've been working with batteries since 1989. I started out as a parts guy, then transitioned over to being a battery service tech for many years at multiple companies. I also spent about seven years in battery sales and, more recently, I was an applications engineer. In that role I conducted power studies to understand what batteries and chargers were best for specific operations. I've worked on pretty much every side of the battery industry, and that knowledge and experience really helps me know what our customers need and how they can get the most from their batteries."

Building a new battery program at JIT Toyota-Lift

"When JIT talked to me about their new battery division, I was excited for the chance to work with them and help create the program. I used to sell to JIT, so I was familiar with some of the people there and knew it was a good company. What's great about building this in house service is that we can drastically reduce response times for battery issues—sometimes from four days to one day—compared to waiting on the manufacturer. Our goal is to save our customers a lot of time and money on their batteries in the long run."

A One Stop Shop

For all your forklift battery needs

"When I was a service tech and would go to a customer to perform a repair, I'd make a point to inspect all their batteries to see if there were any other issues I could help with. That's the type of program we're offering at JIT. More than just repairs, we're providing full battery consulting and maintenance. Our guys can come out regularly to water your batteries, clean all the corrosion and acid off, and inspect them for additional problems. We can take some of that responsibility off of our customers' shoulders and help their batteries perform better and last longer."

-Bill Larkin

Best Practices

Battery Safety Tips

Check electrolyte levels WEEKLY

A key part of forklift battery maintenance is adding water to it at regular intervals, typically weekly or every five to ten recharges. It's important to only fill up to the level indicated within your battery, as overfilling can lead to serious damage. It's also important to top up the water only after charging, not before, to avoid overflowing.

View our tips and safety rules below to optimize forklift battery life and help prevent accidents in your facility. Plus, download our Battery Safety Audit form to ensure your team follows proper battery procedures.
